The scissor lift got its name from the unique design which lifts its platform in the air. The platform is raised when the linked, folding supports under are drawn together, in scissor-like fashion, propelling it upward. At its tallest height, a scissor lift could extend from 6.4 to 18.8 meters in the air which really depends on the model. Hydraulics or an electric motor are used to be able to propel the platform in the air, moving slower at the end and faster in the middle of the lift.

Ever since the original designs of the scissor lift was developed during the 1970s, they are still being constructed according to the same basic designs. Nevertheless, some of the materials used have been constructed better as well as there being far better safety implements involved into the designs. New models could travel over the smooth floor of a warehouse or the uneven ground of a construction site. The unit was designed to assist productivity in the many retail establishments that were growing bigger. Compared to the forklift, the scissor lift is more portable and more useful in retail environment. They are the only industrial platforms which can be retracted and placed into a relatively small storage place.
